

Advice - Responsible Dataset Scope

Professional Research Project 2 | Fine-Tuning for Guarani Mbya

Document type	Portfolio evidence
Learning Outcome	LO2 - Advising
Related Decision Log	DL2 - Choosing the Training Dataset
Main advice	Use Guarani Wikipedia as a technical low-resource fine-tuning prototype dataset.

1. Advice

Based on my dataset decision, I advise using Guarani Wikipedia as the main training dataset for a technical low-resource fine-tuning prototype. The project is inspired by the Guarani Mbya case, but the selected dataset is Paraguayan Guarani from Wikipedia. Therefore, the final model should not be presented as a real Guarani Mbya writing assistant or as a community-approved language tool.

2. Why this advice is needed

This advice is needed because the dataset choice influences the claims I can responsibly make. Guarani Wikipedia makes the project technically feasible because it provides public, real Guarani text that can be cleaned, split, and used for fine-tuning. However, it does not solve the cultural and linguistic limitation of the original project inspiration. Public availability does not mean community approval, and Paraguayan Guarani should not be treated as the same as Guarani Mbya.

3. Trade-off

The trade-off is that Guarani Wikipedia gives me enough usable text to build and evaluate a fine-tuning workflow within the deadline, but it limits the final claim. The project can demonstrate dataset preparation, model selection, fine-tuning, demo creation, and memorization versus generalization evaluation. It cannot claim to preserve Guarani Mbya or represent the quality of Guarani Mbya language use.

4. How this advice affects the project

This advice changes how I will document and present the rest of the project. In the portfolio, demo, evaluation, and final explanation, I need to clearly state that the model is a prototype trained on Paraguayan Guarani Wikipedia data. The evaluation should focus on technical behavior, such as useful output, bad output, or memorized output. It should not judge real Guarani Mbya language quality without native-speaker or community review.

5. Evidence linked to this advice

This advice is linked to DL2 - Choosing the Training Dataset, the Dataset Selection Flow document, the Data Cleaning & Splitting notebook, and the project description. Together, these artifacts show the reasoning behind the dataset choice, the technical preparation of the data, and the ethical reason for limiting the project claims.

6. Portfolio placement

This evidence should be placed under LO2 - Advising. It can also be linked from the PRP2 collection description because it explains the responsible scope of the whole project.

7. Final recommendation

Do not skip this evidence. It fills the empty Advising part and explains the project limitation before model selection and fine-tuning.
